

CARBIDE BLADES SAFETY INSTRUCTIONS

GENERAL SAFETY INSTRUCTIONS

Follow all safety and operation instructions according to OSHA STANDARDS for SAFETY and HEALTH.

Follow all safety and operation instructions according to ANSI B7.1 AMERICAN NATIONAL SAFETY STANDARDS.

Follow all operational and safety instructions supplied with the tools being used.

CARBIDE BLADES

- Check the blade for damage before using it. A damaged blade will be unbalanced and could break and seriously injure the operator and anyone in the area.
- Make sure you are using the proper power tool for the blade being used.
- All safety guards must be used on the tool.
- Read operation instructions provided with the tool.
- Check the tool for the proper mounting flanges for the blade being used.
- Make sure the tool is in proper operating condition.
- Do not exceed maximum operating speed of the blade.
- Must wear safety glasses to protect eyes.
- Must wear face mask for dust protection.
- Must use gloves to protect hands.
- Do not use blades near other people unless they are also wearing safety equipment.
- Make sure the material being worked on is anchored securely. Material not held securely could cause the blade to break or the tips on the blade to break off, which could seriously injure the operator and anyone in the area.
- Use the blades only on materials for which they are intended. Improper use of the blade could cause the blade itself or the tips on the blade to break off, which could seriously injure the operator and anyone in the area.
- If not properly used, carbide tips on the blade can break and cause injury.
