

How do I plant the seeds?

Fill the Grass Planter base with water and allow the seeds to soak overnight.

Cover the bowl with a sheet of paper towel.

Rinse and pour the seeds into the bowl to let dry for a few hours.

Afterwards, keep the seeds moist with a wet paper towel or spray bottle.

Keep at it until the seeds
have sprouted. Lift them out by holding the paper towel by its corners.

Add the bag of vermiculite
to the bowl.

Spread the sprouted seeds evenly onto the vermiculite surface. Do not mix.

Add the grid cover once the grass starts growing.

Water every so often. After a few days, the grass is ready.

How long does it take for the grass to grow?

It takes about 10 days for the grass to become fully grown
