

BRITA INDICATORS

BRITA produce many different jug systems and each model will use one of 3 filter indicators. Please see below for the different types of indicator –

The **BRITA Memo** is a digital clock that will automatically count down a set period of 4 weeks. Upon testing it was found that in average water hardness conditions this was the estimated lifespan of a BRITA filter cartridge. Each cartridge has the capacity to filter up to about 100 litres of mains tap water in the UK.

The **BRITA® Meter** is the first filter cartridge exchange indicator to take your individual usage situation into account. The BRITA® Meter determines the optimal time for cartridge replacement depending on the quantity of water filtered, water quality (hardness) and time for which the cartridge has been in use. The BRITA® Meter is equipped with an integrated conductivity measuring gauge to determine the water hardness, a volume counter which measures the number of filtered litres while the cartridge is in use and a timer. If it is the meter that is required please can you confirm the size of your jug? Is it an XL or Cool, a slim line jug that will fit into the fridge door?

The **LED Smart Light** status indication is based on time and volume measurement. The BRITA LED Smart Light has a tilting sensor. It recognizes the degree of tilting of the Style jug. Once the jug is tilted more than 30 degrees, the software inside the LED Smart Light starts counting the time the jug is being tilted hence how long water is being poured out of the jug. The BRITA LED Smart Light is not only measuring the time since the last activation of the cartridge status indicator but also registers the volume of water filtered with the BRITA fill&enjoy Style. Using the intuitive traffic light logic, the BRITA LED Smart Light will communicate the status of the filter cartridge in a user friendly way any time.

Resetting your indicator

Please [click here](#) for a video regarding indicators.
We hope you find this helpful.

The indicator will need to be reset with each cartridge change to advise when your cartridge needs changing

Memo

Hold down the start button until all 4 bars flash twice

Meter

Hold down the start button until all 4 bars flash twice

LED Smart Meter

Hold down light button on top of jug for **5 – 10 seconds** until light pulses green three times

The light will only pulse 3 times after water has been poured to show cartridge status
