

I'm experiencing a rattling/bubbling noise with my Kraken cooler. What should I do?

Updated 7 months ago

If you are experiencing an issue where you hear an audible rattling noise from the pump, try disconnecting the fans that are connected to the radiator and see if the noise continues. We have seen the fans creating noise over time after long use. If the fans are the issue, please contact our Customer Support Team to ask for replacement fans.

If the fans are not the issue, it could possibly be air bubbles in the pump causing this noise. Try the following troubleshooting steps to see if it helps to clear out any air bubbles:

- Set the pump to 100% and let it stay like that for 1 hour, then turn it back down and see if the noise goes away.
- Follow the video embedded below on how to work out the bubbles as well.

How to Quiet a Noisy Asetek Liquid Cooling Pump

If the troubleshooting steps above did not work, please record a video of the issue and upload this video to Google Drive/Dropbox and provide this video of the sound to our customer service team.
