⚠ Important Safety Instructions ⚠

Please save these instructions.

This manual contains important safety, installation, and operating instructions for the charge controller. The following symbols are used throughout the manual:

WARNING	Indicates a potentially dangerous condition. Use extreme caution when performing this task
CAUTION	Indicates a critical procedure for safe and proper operation of the controller
NOTE	Indicates a procedure or function that is important to the safe and proper operation of the controller

General Safety Information

- Read all of the instructions and cautions in the manual before beginning the installation.
- There are no serviceable parts for this controller. Do **NOT** disassemble or attempt to repair the controller.
- Make sure all connections going into and from the controller are tight. There may be sparks when making connections, therefore, make sure there are not flammable materials or gases near installation.

Charge Controller Safety

- **NEVER** connect the solar panel array to the controller without a battery. Battery must be connected first. This may cause a dangerous occurrence where the controller would experience a high open circuit voltage at the terminals.
- Ensure input voltage does not exceed **25 VDC** to prevent permanent damage. Use the Open Circuit (Voc) to make sure the voltage does not exceed this value when connecting panels together in series.
- The charge controller should be installed indoors in a well-ventilated, cool, and dry environment.
- Do NOT allow water to enter the controller.

Battery Safety

- Do **NOT** let the positive (+) and negative (-) terminals of the battery touch each other.
- Use only sealed lead-acid, flooded, gel or lithium batteries which must be deep cycle.
- Explosive battery gases may be present while charging. Be certain there is enough ventilation to release the gases.
- Be careful when working with large lead acid batteries. Wear eye protection and have fresh water available in case there is contact with the battery acid.
- Over-charging and excessive gas precipitation may damage the battery plates and activate material shedding on them. Too high of an equalizing charge or too long of one may cause damage. Please carefully review the specific requirements of the battery used in the system.
- Equalization is carried out only for non-sealed / vented / flooded / wet cell lead acid batteries.
- Do **NOT** equalize VRLA type AGM / GEL / LITHIUM batteries **UNLESS** permitted by battery manufacturer.
- Default charging parameters in Li mode are programmed for 12.8V Lithium Iron Phosphate (LFP) Battery only. Before using Wanderer to charge other types of lithium battery, set the parameters according to the suggestions from battery manufacturer.

WARNING

Connect battery terminals to the charge controller **BEFORE** connecting the solar panel(s) to the charge controller. **NEVER** connect solar panels to charge controller until the battery is connected.

Table of Contents

General Information

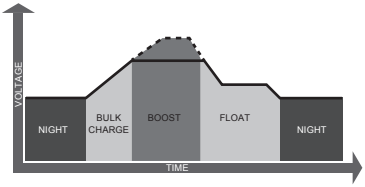
The Wanderer is an advanced charge controller for off-grid solar applications and can be used with a 12V battery or battery bank. Integrating highly efficient PWM charging, the Wanderer increases battery life and improves system performance. The controller comes equipped with fully comprehensive self-diagnostics and electronic protection functions to prevent damage from installation mistakes or system faults.

Key Features

- Optimized for 12 VDC system voltage
- 30A charging capacity.
- Deep Cycle Sealed, Gel, Flooded and Lithium battery options.
- 4 Stage PWM charging: Bulk, Boost. Float, and Equalization
- Temperature compensation and correcting the charging and discharging parameters automatically, improving battery lifetime.
- Protection against: reverse current, overcharging, short-circuit and reverse polarity.
- Negative ground controller
- Multiple LED indicators for easy to read charge status and battery information.
- Remote temperature compensation compatible (accessory sold separately)
- Integrated communication port for remote monitoring.
- Charges over-discharged lithium batteries.

PWM Technology

The Wanderer utilizes Pulse Width Modulation (PWM) technology for battery charging. Battery charging is a current based process so controlling the current will control the battery voltage. For the most accurate return of capacity, and for the prevention of excessive gassing pressure, the battery is required to be controlled by specified voltage regulation set points for Absorption, Float, and Equalization charging stages. The charge controller uses automatic duty cycle conversion, creating pulses of current to charge the battery. The duty cycle is proportional to the difference between the sensed battery voltage and the specified voltage regulation set point. Once the battery reached the specified voltage range, pulse current charging mode allows the battery to react and allows for an acceptable rate of charge for the battery level. The Wanderer has a 4-stage battery charging algorithm for a rapid, efficient, and safe battery charging. They include: Bulk Charge, Boost Charge, Float Charge, and Equalization.



Bulk Charge: This algorithm is used for day to day charging. It uses 100% of available solar power to recharge the battery and is equivalent to constant current.

Boost Charge: When the battery has charged to the Boost voltage set-point, it undergoes an absorption stage which is equivalent to constant voltage regulation to prevent heating and excessive gassing in the battery. The Boost time is 120 minutes.

Float Charge: After Boost Charge, the controller will reduce the battery voltage to a float voltage set point. Once the battery is fully charged, there will be no more chemical reactions and all the charge current would turn into heat or gas. Because of this, the charge controller will reduce the voltage charge to smaller quantity, while lightly charging the battery. The purpose for this is to offset the power consumption while maintaining a full battery storage capacity. In the event that a load drawn from the battery exceeds the charge current, the controller will no longer be able to maintain the battery to a Float set point and the controller will end the float charge stage and refer back to bulk charging.

Equalization: Is carried out every 28 days of the month. It is intentional overcharging of the battery for a controlled period of time. Certain types of batteries benefit from periodic equalizing charge, which can stir the electrolyte, balance battery voltage and complete chemical reaction. Equalizing charge increases the battery voltage, higher than the standard complement voltage, which gasifies the battery electrolyte.

WARNING Once equalization is active in the battery charging, it will not exit this stage unless there is adequate charging current from the solar panel. There should be NO load on the batteries when in equalization charging stage.

WARNING Over-charging and excessive gas precipitation may damage the battery plates and activate material shedding on them. Too high of equalizing charge or for too long may cause damage. Please carefully review the specific requirements of the battery used in the system.

Lithium Battery Activation

The Wanderer PWM charge controller has a reactivation feature to awaken a sleeping lithium battery. The protection circuit of lithium battery will typically turn the battery off and make it unusable if over-discharged. This can happen when storing a lithium battery pack in a discharged state for any length of time as self-discharge would gradually deplete the remaining charge. Without the wake-up feature to reactivate and recharge batteries, these batteries would become unserviceable and the packs would be discarded. The Wanderer will apply a small charge current to activate the protection circuit and if a correct cell voltage can be reached, it starts a normal charge.

Optional Components

The Wanderer is shipped with by itself with no additional components. Optional components that require a separate purchase:

Remote Temperature Sensor (TS-R):

Measures the temperature at the battery and uses this data for very accurate temperature compensation. The sensor is supplied with a 9.8ft cable length that connects to the charge controller.

BT-1 Bluetooth Module:

The BT-1 Bluetooth module is a great addition to any Renogy charge controllers with a RS232 port and is used to pair charge controllers with the Renogy BT App. After pairing is done you can monitor your system and change parameters directly from you cell phone or tablet. No more wondering how your system is performing, now you can see performance in real time without the need of checking on the controller's LCD.

Identification of Parts

Key Parts

1. Battery Select Button
2. Battery Type Indicator
3. Battery Indicator
4. PV Indicator
5. Remote Temperature Sensor Port (optional accessory)
6. PV Terminals
7. Battery Terminals
8. RS-232 Port (optional accessory)

Installation

WARNING

Connect battery terminal wires to the charge controller FIRST then connect the solar panel(s) to the charge controller. NEVER connect solar panel to charge controller before the battery.

CAUTION

Do not over-torque or over tighten the screw terminals. This could potentially break the piece that holds the wire to the charge controller.
Refer to the technical specifications for max wire sizes on the controller and for the maximum amperage going through wires.

Mounting Recommendations:

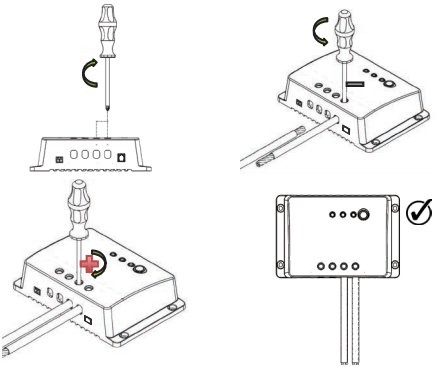
WARNING Never install the controller in a sealed enclosure with flooded batteries. Gas can accumulate and there is a risk of explosion.

1. **Choose Mounting Location—**place the controller on a vertical surface protected from direct sunlight, high temperatures, and water. Make sure there is good ventilation.
2. **Check for Clearance—**verify that there is sufficient room to run wires, as well as clearance above and below the controller for ventilation. The clearance should be at least 6 inches (150mm).
3. **Mark Holes**
4. **Drill Holes**

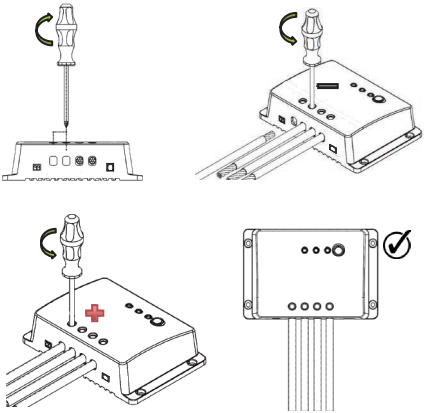
NOTE **The Wanderer is not equipped with screws for wall mounting.**

5. **Secure the charge controller.**

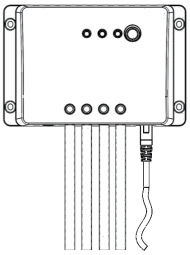
Battery



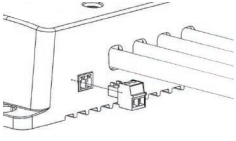
Solar Panel

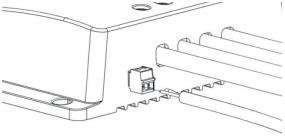


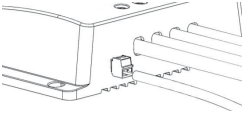
Bluetooth Module Communication (optional)

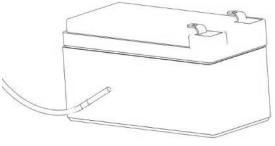


Temperature Sensor (optional, not polarity sensitive)









Place the sensor close to the battery

Operation

After connecting the battery to the charge controller, the controller will turn on automatically. Operation of this controller is very simply. Users set the battery type, and leave the rest of the work to the charge controller.

Setting Battery Type

Simply hold the gray button for approximately 7 seconds until the LED flashes. Once flashing, then press the gray button again to the desired battery type (they are color coded) and simply leave the controller alone until the flashing stops (this should take approximately 10 seconds). This indicates the parameter has been set.

NOTE If the LED lights do not flash, hold the gray button for 7 seconds again, release, and immediately press the gray button again to enable the flashing.

Set Battery Type			
Sealed (Green)	Gel (Orange)	Flooded (Red)	Li (Blue)

LED Indicators

The Wanderer is a simple to use controller requiring little to no maintenance. Users can be informed about the charge controller's status based on the LED indicators at the PV and Battery levels. The following chart goes into further detail regarding the Wanderer's indicators.

PV Indicator	BATT Indicator	Controller Status
Fast Flashing (Green)	n/a	PV terminal is over-voltage
Solid (Green)	n/a	PV terminal low output
Slow Flashing (Green)	Solid (Green)	Battery is charging normally
Slow Flashing (Green)	Slow Flashing (Green)	The battery is in float charge
n/a	Fast Flashing (Green)	The battery is over-voltage
n/a	Solid (Orange)	The battery is under-voltage
n/a	Solid (Red)	The battery is over-discharged
n/a	Slow Flashing (Red)	The battery is over-heating

System Status Troubleshooting

Description	Troubleshoot
Battery is low-voltage	Use a multi-meter to verify the rated battery voltage. Disconnect any loads connected to the battery to allow it to charge.
Battery is over-voltage	Use a multi-meter to check the voltage of the battery. Make sure the battery voltage is not exceeding the rated specification of the charge controller. Disconnect battery.
PV is over-voltage	Use a multi-meter to check the voltage of the panels. Ensure that they meet the specification of the controller to not exceed 25 VDC.
PV terminal low output	The PV output is typically lower in the early mornings and in the late afternoons. This should not require troubleshooting unless a solar panel is defective.
Battery is over-heating	When heat is exceeding the specification of the controller, it will automatically shut down. The controller will resume to operate once it interprets a change in temperature.
Other Considerations	
Charge controller does not charge during daytime when the sun is shining on the solar panels.	Confirm that there is a tight and correct connection from the battery bank to the charge controller and the solar panels to the charge controller. Use a multi-meter to check if the polarity of the solar modules have been reversed on the charge controller's solar terminals.
No LED indicator when battery is connected to the charge controller	The battery voltage may be less than 9V. A minimum of 9V is required to power on the controller.
Battery LED light does not flash when holding for 7 seconds.	The battery selection LED must be enabled. Disconnect the battery from the controller, then connect the battery to the controller to reset it. Then hold the gray button for 7 seconds, release the button, and then immediately press the gray button one more time to select a battery type.

Maintenance

For best controller performance, it is recommended that these tasks be performed from time to time.

1. Check that controller is mounted in a clean, dry, and ventilated area.
2. Check wiring going into the charge controller and make sure there is no wire damage or wear.
3. Tighten all terminals and inspect any loose, broken, or burnt up connections.

Fusing

NEC Maximum Current for different Copper Wire Sizes									
AWG	16	14	12	10	8	6	4	2	0
Max. Current	18A	25A	30A	40A	55A	75A	95A	130A	170A

Please Note: The NEC Code requires overcurrent protection shall not exceed 15A for 14 AWG, 20A for 12 AWG, and 30A for 10 AWG copper wire.

Fuse from Controller to Battery

Controller to Battery Fuse = Current Rating of Charge Controller
Ex. 30A Wanderer = 30A fuse from Controller to Battery

Fuse from Solar Panel(s) to Controller

Ex. 200W; 2 X 100 W panels

Parallel
Total Amperage = Isc1 + Isc2 = (5.75A + 5.75A) * 1.56

Fuse = minimum of 11.5 * 1.56 = 17.94**= 18A fuse**

Technical Specifications

Electrical Specifications

Description	Parameter
Nominal system voltage	12 VDC
Rated Charge Current	30A
Max. PV Input Voltage	25 VDC
Self-Consumption	≤10mA
Temp. Compensation	-3mV/°C/2V
Max. Terminal Size	10mm 8 AWG
Working Temperature	-35°C to +45°C / -20°F to 113°F
Net Weight	0.29 kg 0.65 lb.
Dimensions	163.8 x 109.6 x 44.7mm 6.5 x 4.3 x 1.8in
Enclosure	IP20
Communication	RS232
Certification	CE, RoHS, FCC Part 15 Class B, RCM

This equipment has been tested and found to comply with the limits for a class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

•Reorient or relocate the receiving antenna.
•Increase the separation between the equipment and receiver.
•Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
•Consult the dealer or an experienced radio/TV technician for help.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Battery Charging Parameters

Battery Type	SEALED/AGM	GEL	FLOODED	LI (LFP)
Over-voltage Warning	16 V	16 V	16 V	16 V
Charging Limit Voltage	15.5 V	15.5 V	15.5 V	15.5 V
Over-voltage Recover	15 V	15 V	15 V	15 V
Boost Charge Voltage	14.6 V	14.2 V	14.6 V	14.2 V (User:12.6-16V)
Float Charge Voltage	13.8 V	13.8 V	13.8 V	-----
Equalization Voltage	-----	-----	14.8 V	-----
Boost Return Voltage	13.2 V	13.2 V	13.2 V	13.2 V
Under Voltage Warning	12V	12V	12V	12.1V
Under Voltage Recover	12.2V	12.2V	12.2V	12.3V
Over-discharge Warning	11.1V	11.1V	11.1V	11.1V
Over-discharge Recover	12.6 V	12.6 V	12.6 V	12.6 V
Boost Duration	2 hours	2 hours	2 hours	-----
Equalization interval	-----	-----	28 days	-----
Equalization Duration	-----	-----	2 hours	-----

* Battery charging parameters in LI mode can be programmed using Renogy BT App.

** Default charging parameters in LI mode are programmed for 12.8V LFP battery. Before using Wanderer to charge other types of lithium battery, set the parameters according to the suggestions from battery manufacturer.

RENOGY MTS-ZB

RENOGY Photovoltaic Module Z-Bracket Mounting System

Version 1.2

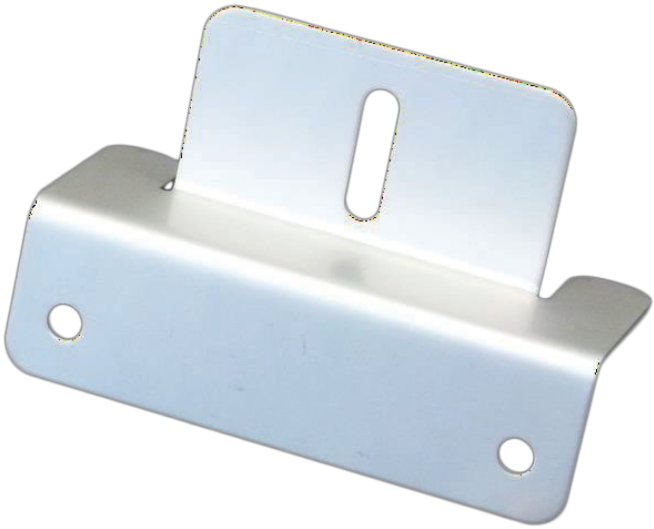

Table of Contents

⚠ Important Safety Instructions ⚠

Please save these instructions.

This manual contains important safety, installation, and operating instructions for the Renogy Z-Bracket Mount hardware system. The following symbols are used throughout the manual to indicate potentially dangerous conditions or important safety information.

WARNING	Indicates a potentially dangerous condition. Use extreme caution when performing this task.
CAUTION	Indicates a critical procedure for safe and proper operation of the system.
NOTE	Indicates a procedure or function that is important to the safe and proper operation of the system.

General Safety Information

- Read all of the instructions and cautions in the manual before beginning the installation.
- Installation should be completed by a professional contractor to avoid damages that may be incurred due to improper sealing.
- Do NOT substitute parts from other manufacture ring sources, doing so may void the warranty and/or result in an unstable system
- This system is NOT possess any compliance with residential structural codes and should not be used in place of a system that is, if so required by local regulations

Installer Responsibilities

- Installation compliance with any applicable codes which are in force at the installation site
- Installation compliance and compatibility with all system components and the environment including but not limited to roofing, system components, etc.
- Verification that all project information is accurate

General Information

The Renogy Z-Bracket Mount System is designed to support the installation of single panel units, generally in off-grid installations. These units are ideal for installation on RV roofs and non-inhabited dwellings such as sheds or garages. It is also suited as attachment to a user made structure such as a wooden frame. The system comes complete with all fasteners to secure the system to the installation surface. This system makes the installation of small solar systems easy, affordable and quick.

Key Features

- Lightweight
- Aluminum corrosion-free construction
- Ideal for RV's and boats
- Ease of installation
- 1-year material warranty

Identification of Parts

Image	Composant	Description
	Z-Bracket	Main component. Secures panels to mounting surface using the included fasteners.
	M6 x 16mm Hex Cap Bolt	Fastener used to secure panel to Z-Bracket. Material: Stainless Steel

	M6 Split Lock Washer	Deformable washer which creates a spring force from deformation. Provides the necessary preload to cap bolt.
	M6 Flat Washer	Normal flat washer used to prevent surface marring on components from the use of the Lock Washers.
	M6 Hexagona	Used to tighten down joint between Z-Bracket and panel.
	#10 x 1¼ in Self-Drilling Cap Screw	Screw capable of self-drilling into the mounting surface. Used to secure the Z-Bracket to the mounting surface. Material: Steel
	Plastic Retaining Ring	Placed between the self-drilling screws and the Z-Bracket. Should come threaded over self-drilling screws in package.

Installation

Recommended tools to have before installation:

The following tools and equipment are highly recommended to have available to assist with installation but are in no way a comprehensive list of tools that can ease installation. Installers feel free to substitute comparable equipment where appropriate.

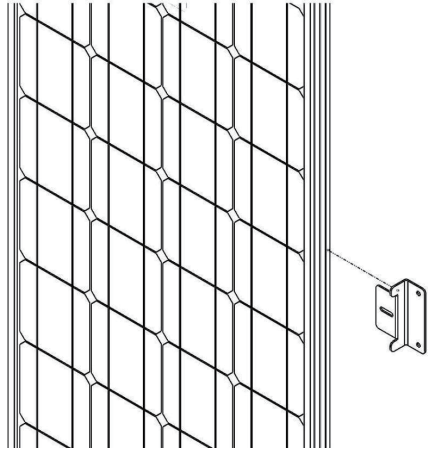
Image	Composant	Description
	Ratchet Wrench	Allows for tightening of fasteners.
	6mm Socket Drive	Used with ratchet to tighten down bolted joint between panel and Z-Bracket.
	5/32” Socket Drive	Used with ratchet to drive screw into mounting surface and secure Z-bracket to it.
	Center Punch	Indents mounting surface to reduce screw wandering during initial drive.
	Crescent Wrench	Used to prevent rotation of the nut during joint tightening until split lock washer has effectively engaged.

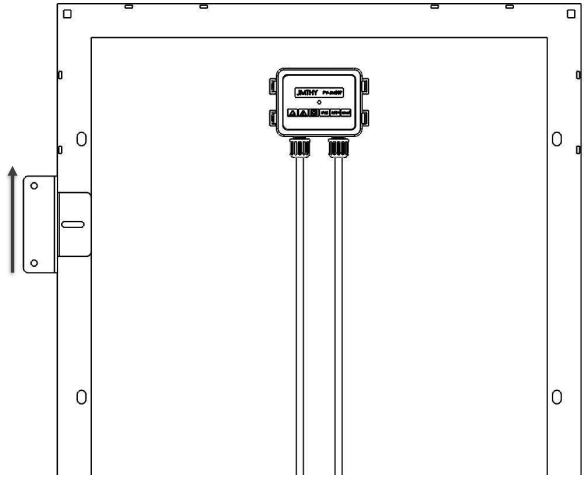
	Tape Measure	May be useful in planning Z-Bracket configuration and positioning.
	Caulking Gun	Used to direct sealant into penetrations to avoid leaking.
	Compatible Sealant	Sealant compatible with your specific installation.
	Spirit Level	Used to ensure panel is level and/or plumb to the mounting surface and orientation.

WARNING

Installation on shingle roofs is not recommended. System is not designed with these roof types in mind. Fasteners will not penetrate framing deep enough and will likely cause heavy issues with leaking.

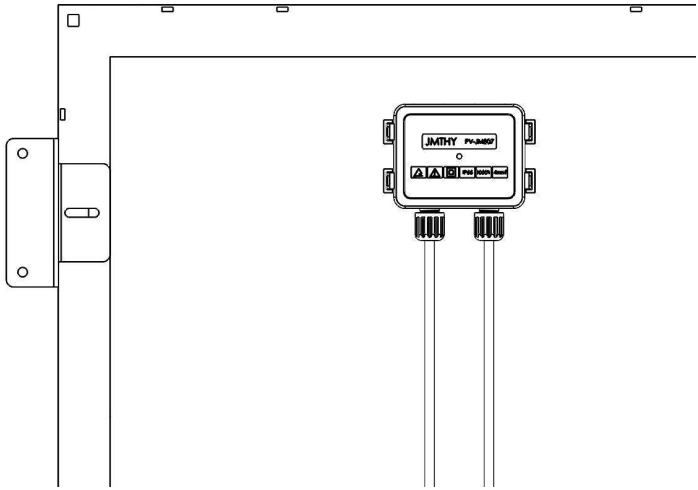
Mating Brackets to Panel Frame



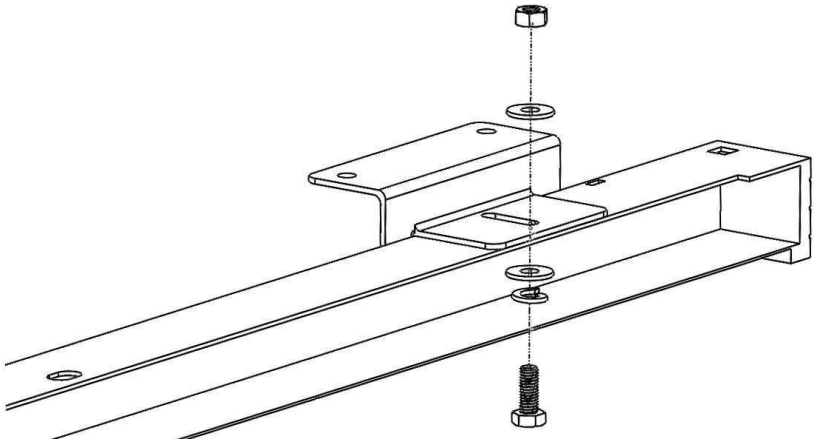


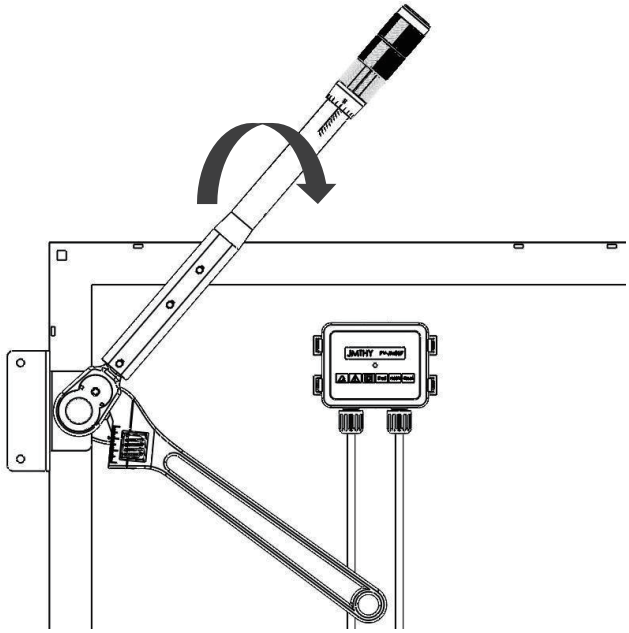
NOTE

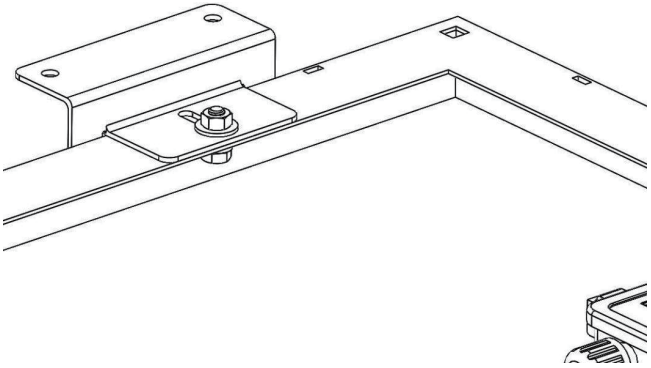
Various solar modules will have different varieties of mounting hole locations. Please align brackets in a way that will evenly support the module.



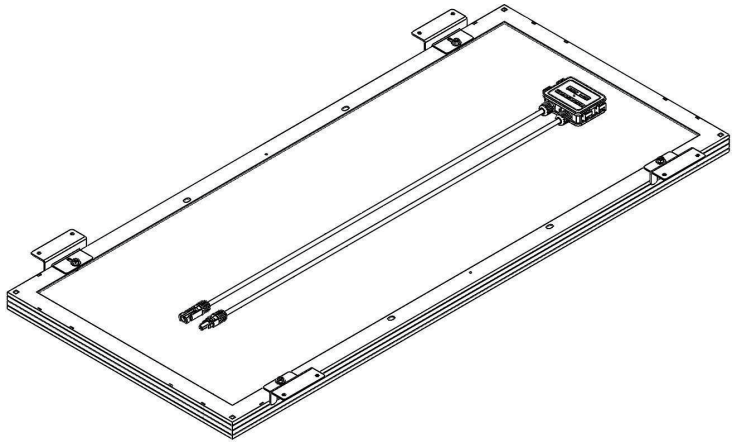
JIMTHY



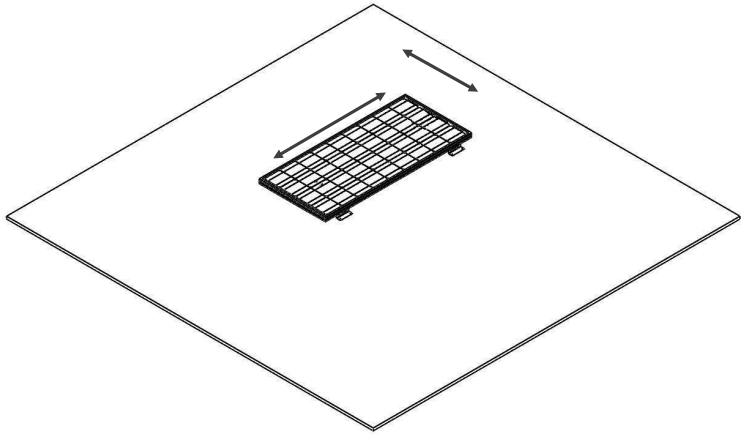


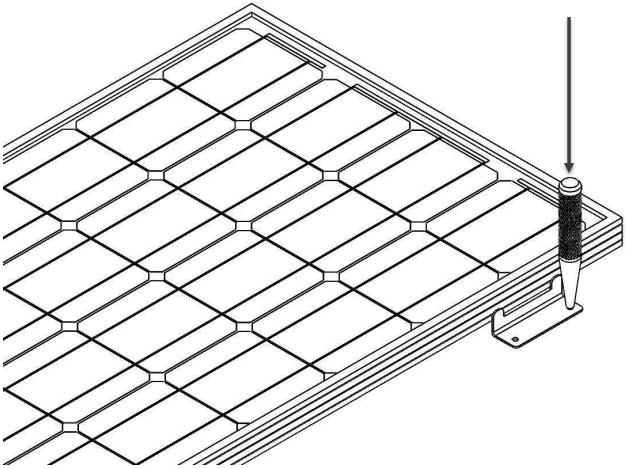


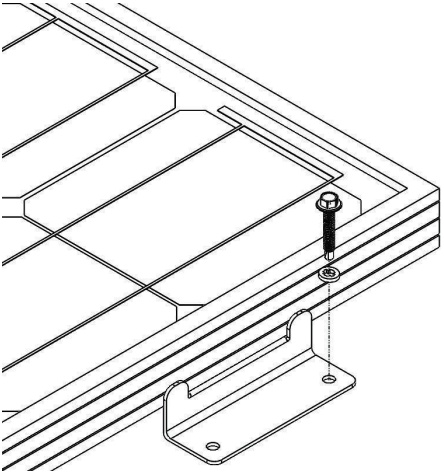
Repeat for each Z-Bracket in the set at each corner.



Install of Panel to General Mounting Surface

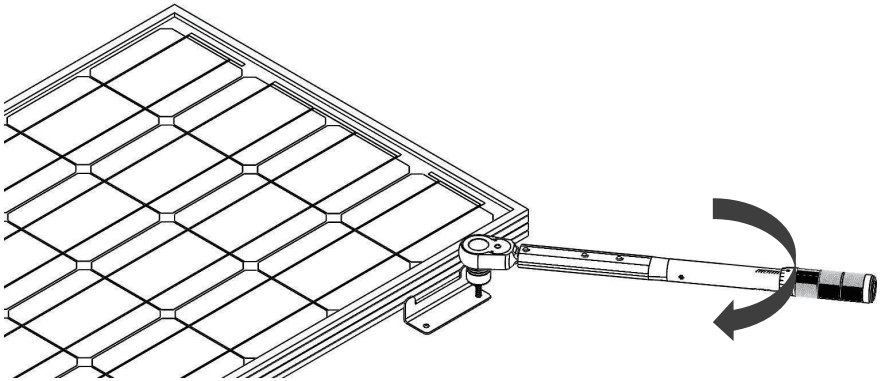


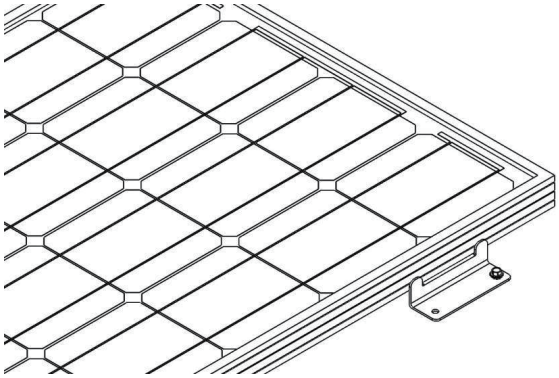


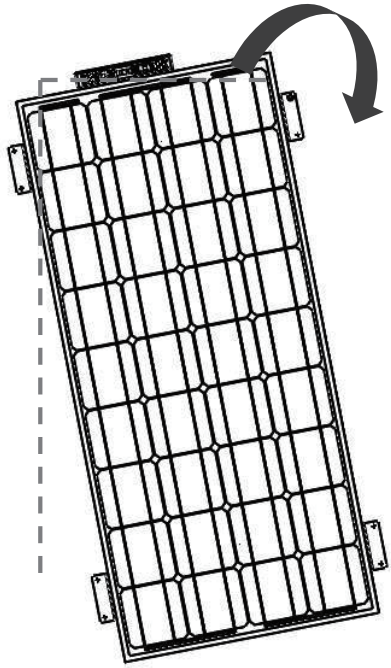


NOTE

Ensure screw locations are backed by structural element such as a rafter, stud, etc.

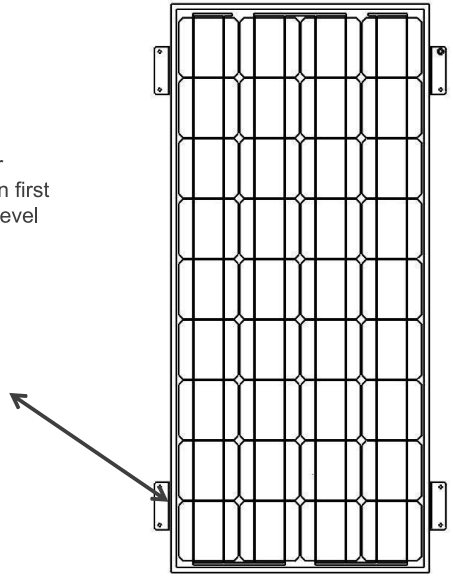






NOTE

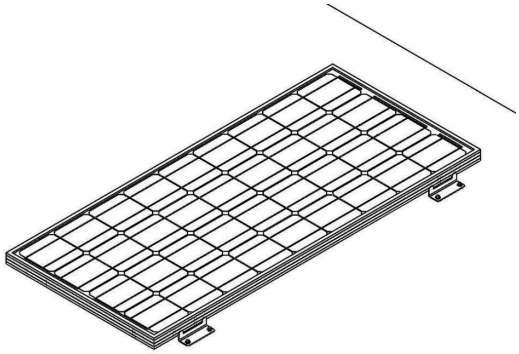
Orient panel in level/plumb layout as desired before fixing in position.

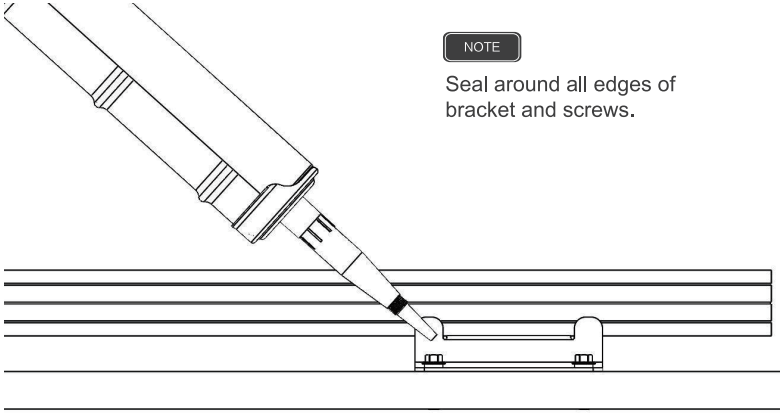


NOTE

Begin new fastener at indicated location first to secure panel in level plumb/level layout.

Repeat for all fastener locations.

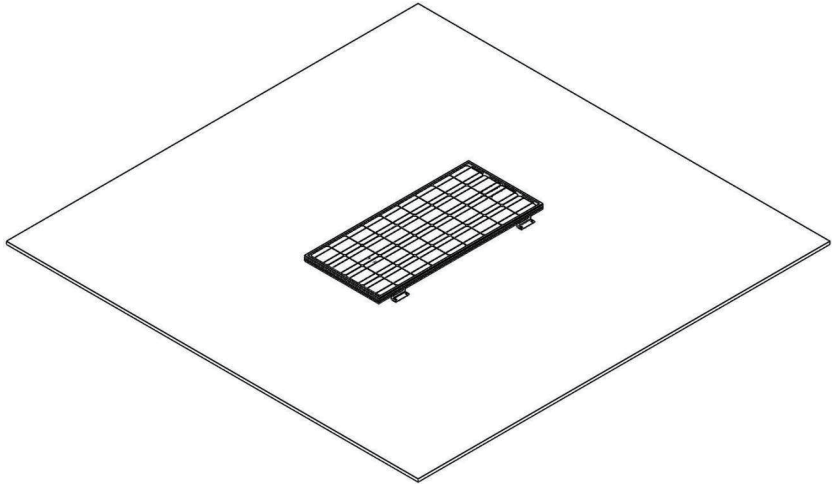




NOTE

Seal around all edges of bracket and screws.

Repeat for all brackets.



Install of Panel to RV Roofs

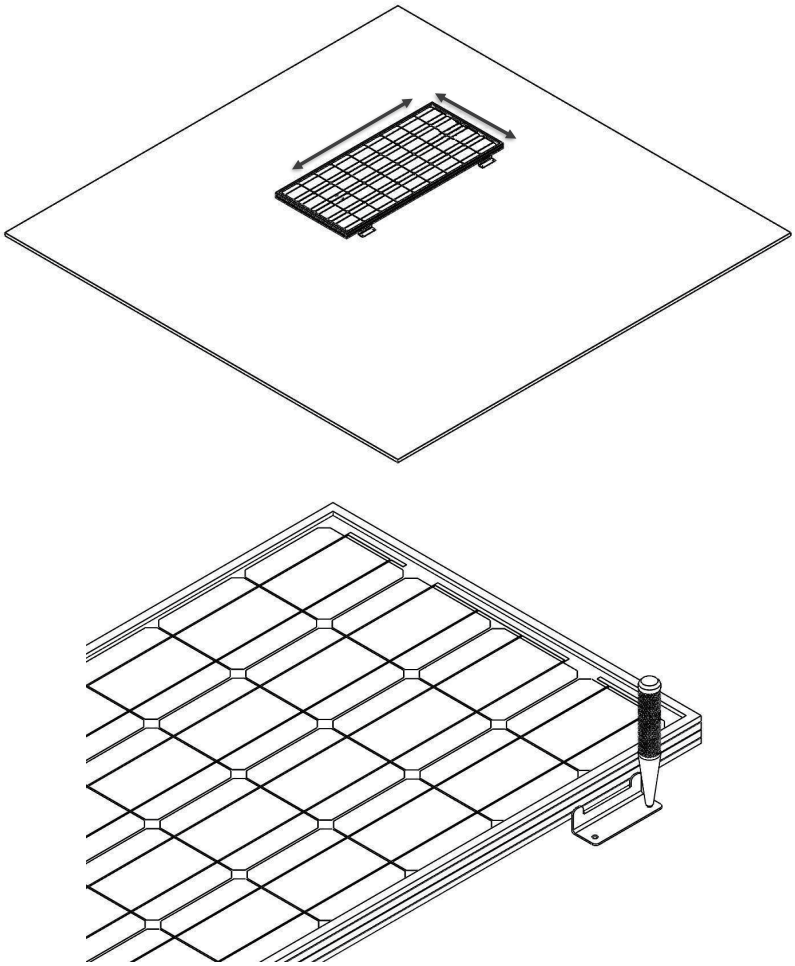
Installation on to the roofs of RV's typically requires more specialized instruction due to the nature of construction of most commercially available RV roofs. Please note that this section includes the use of a fastener type NOT included in the Z-Bracket kit. This section is included for convenience of customers installing to an RV roof. The instructions listed in this section are a modification of the normal installation, all other steps are to be completed normally.

NOTE

A minimum roof thickness of 3/8" is recommended for this type of installation.

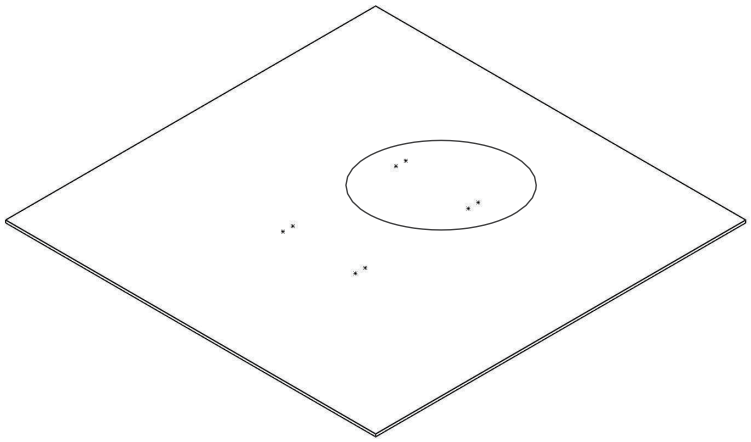
Additional components and tools required for this section:

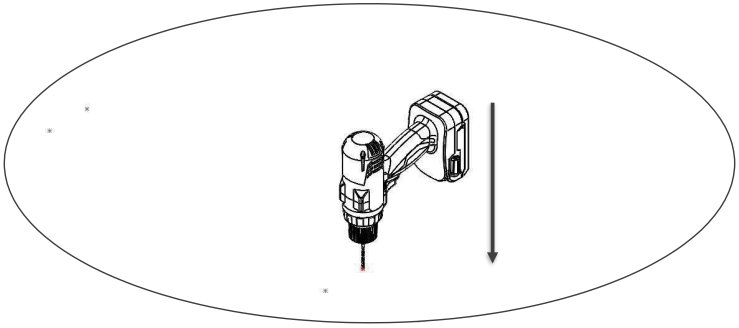
Image	Composant	Description
	Well Nut	Special recessed fastener which expands as the internal fastener is tightened. Allows for fastener to seal within mounting surface and embed itself tightly. Need variety withat least #10-32 internal thread, material thickness supporting roof thickness, and 3/8” hole size. A fastener with suggested features can be found here:
	Machine Screw	Used to secure Z-Brackets to surface with well nut. Must be compatible with chosen well nut by having the same internal thread and not longer than the length of the well nut. Must also purchase compatible flat and lock washers.
	Phillips Head Screw Driver	Used to secure machine screw into well nut.
	Cordless	Used to drill clearance holes for well nuts in roof top.
	Drill Bit	Used with Cordless Drill to create clearance holes for the well nuts. Must be matched to the well nut’s outer diameter. Recommended variety requires 3/8” bit.

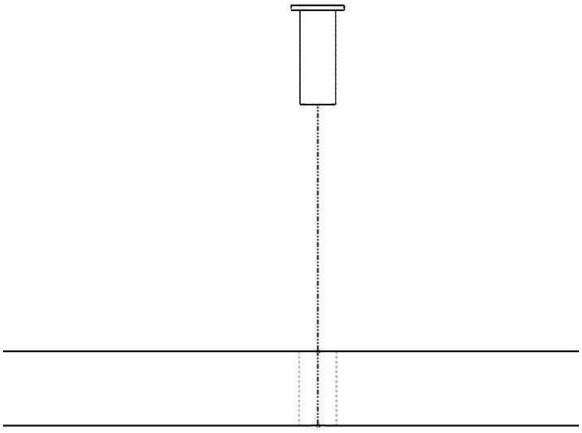


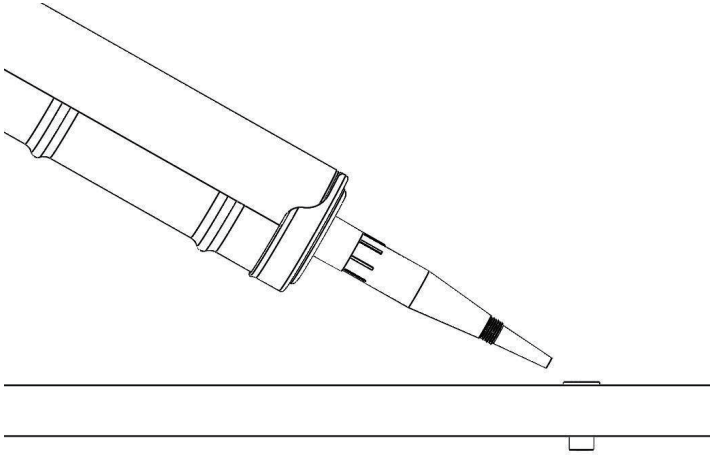
NOTE

Mark all hole locations in this step as the panel must be removed for well nut insertion.





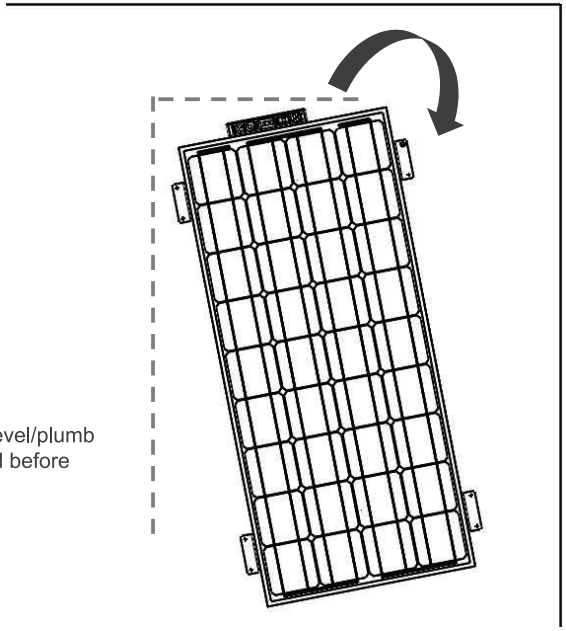




NOTE

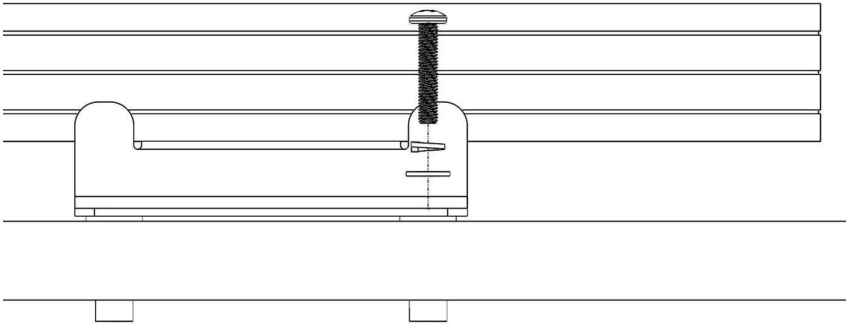
Use of sealant is optional with a well nut but sealing will add extra assurance. Seal under well nut head.

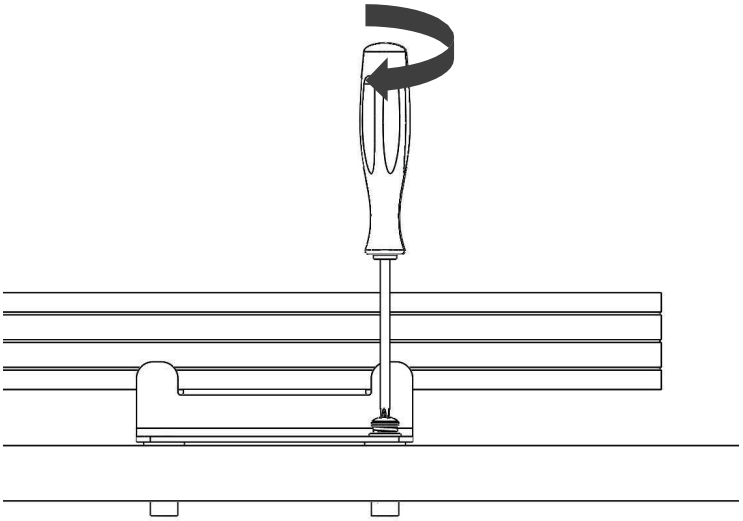
Repeat for all holes.

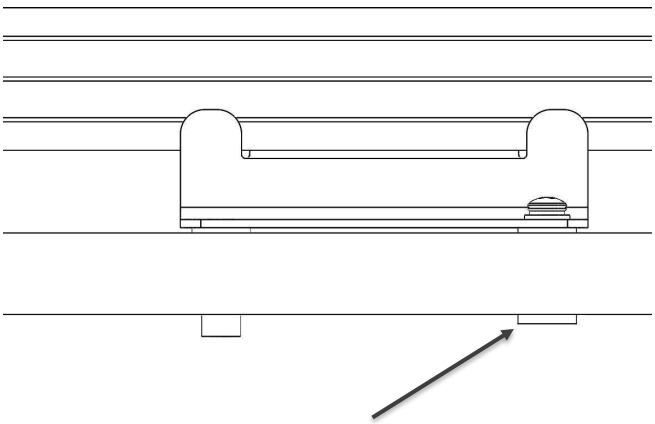


NOTE

Orient panel in level/plumb layout as desired before fixing in position.





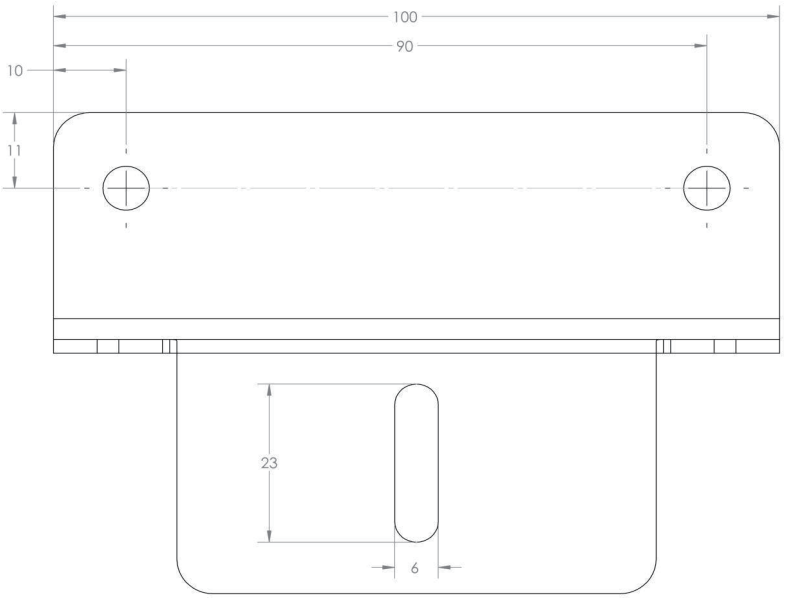


NOTE

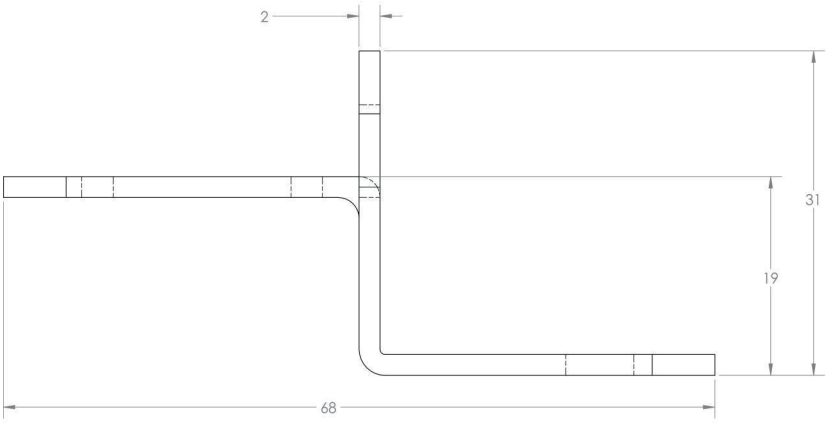
Screw has compressed and expanded the well nut, binding into the roof material.

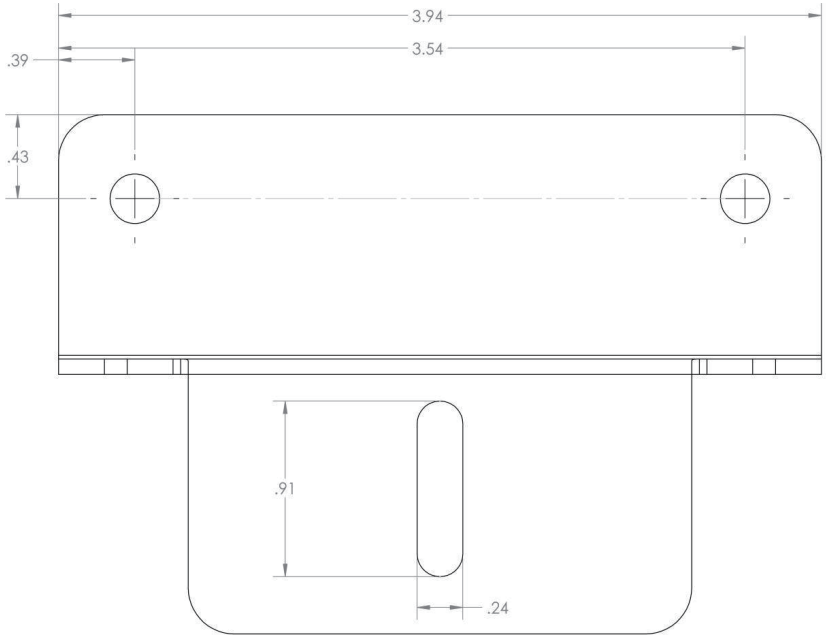
Repeat for all fasteners.

Z-Bracket Dimensions



NOTE Dimensions in millimeters.





NOTE Dimensions in inches.

*This list is not comprehensive and is intended for an “at-a-glance” look at which solar modules provided by Renogy are compatible with the Z-Bracket Mounting System. Modules provided by other manufacturers may work with the Z-Bracket Mounting System provided the follow conditions are met:

1) Solar module weight does not exceed 88 lbs (40 kg) or total load per bracket does not exceed 22 lbs (10 kg).

2) Solar module framing material is constructed of an aluminum alloy.

3) If using a panel oriented such that the distance between Z-Brackets along an edge exceeds 39 in (1 m), it is advisable to add Z-Brackets for mid-span support. Lack of mid-span support can cause excessive stress in the module under load and may result in solar module damage. Consult with your solar module manufacturer if you are unsure of the compatibility.

** These modules require the installation of 2 Z-Bracket sets to ensure the modules do not excessively flex in their mid-span (a total of 8 Z-Brackets per module).
